

APEX DYNAMICS, INC.

Backlash-Free Servo Coupling

Elastomer Type

5 Years Warranty !

Coupling - Elastomer

▶ Features:

- ▶ Backlash Free / High Precision
- ▶ High Torque / High Speed
- ▶ Low Inertia
- ▶ Torsional Rigidity
- ▶ Permissible Eccentric Angle
- ▶ Shock Absorption / Motor High Gain
- ▶ High Frequency Reciprocating
- ▶ Servo / Stepper Motor
- ▶ Spindle Drive
- ▶ Input and Output Shaft Sleeve Type
- ▶ Easy Axial Installation

Ordering Code - Elastomer Coupling

* " K " for Keyway

** " 0 " for Hollow. AA0: Both of the 2 A-type Elastomers in the 2-stage coupling are hollowed.

(1) The dynamic torsional rigidity is the value when the transmitted torque is $0.5 \times T_{KN}$.

(2) T_{KN}/T_{Kmax} is the torque force of elastomer, and connection between the shaft and coupling is checked by the customer.

(1) The value of axial displacements has to be added to the length of the corresponding coupling type. The allowable displacement can only be used alone. If there are displacements in all three directions, the proportion of each deviation must be limited, when installing, keep the distance of SL4 as far as possible to ensure that the axial clearance of the coupling can be maintained during operation.

* The standard fit tolerance is H7/k6, when the shaft bore is $\geq \text{Ø}55$ the fit tolerance is G7/m6. If the fit clearance increased, the transmission torque will be reduced. Steel or ductile iron with reduced surface yield strength of more than 250N/mm^2 can be used as the shaft material, the strength and inner diameter of the shaft/hollow shaft need to be checked.

COUPLING SELECTION ACCORDING TO DIN 740 PART II WITH SPECIFIC FACTORS

Glossary

Rated torque of coupling T_{KN}	Nm	Torque to be continuously transmitted over the entire permissible speed range, taking into account the factors.
Friction torque T_R	Nm	The torque transmitted when the shaft is securely connected to the sleeve.
Rated torque of driving side T_{AN}	Nm	Constant driving torque from the motor.
Peak torque of machine T_S	Nm	Peak torque on the coupling.
Peak torque of driving side T_{AS}	Nm	The peak torque generated when the motor starts or stops.
Mass moment inertia of driving side J_A	kgm ²	Total of moments of inertia existing on the driving side referring to the coupling speed
Mass moment inertia of load side J_L	kgm ²	Total of moments of inertia existing on the load side referring to the coupling speed.
Rotational inertia coefficient of driving side M_A		Factor considering the mass distribution with shocks and vibrations generated on the driving or load side.
Temperature factor S_t		Temperature requirements for the couplings.
Operating factor S_b		Factor for different application.
Starting factor S_z		The number of start-ups per hour.

Calculation

The rated torque T_{KN} of the coupling must be greater than or equal to the rated torque of the equipment T_{AN} , taking into account the temperature coefficient S_t and the operating coefficient S_B .

$$T_{KN} \geq T_{AN} \times S_t \times S_B$$

The rated torque T_{KN} of the coupling must be greater than or equal to the maximum torque T_s applied to the coupling, taking into account the temperature coefficient S_t and the operating coefficient S_B .

$$T_{KN} \geq T_s \times S_t \times S_B$$

Rotational inertia coefficient at the drive side M_A

$$M_A = J_L / (J_A + J_L)$$

Maximum torque at the drive side T_s

$$T_s = T_{AS} \times M_A \times S_Z$$

Under any operation conditions, the friction torque on the coupling bore may not be exceeded.

$$T_R > T_{AS}$$
